FLOW SELECTION VALVES GENERAL INFORMATION

What is a Flow Selection Valve?

Bio-Chem Valve™ Flow Selection Valves combine multiple valve actuators into a single, compact unit. Because each actuator operates independently, Flow Selection Valves can combine or select any combination of between 2 and 8 individual source streams. Valves are situated around a central block, providing flow paths of equal length.

Flow Selection Valves are similar in construction to Bio-Chem Valve™ solenoid operated Isolation Valves. A flexible diaphragm isolates the solenoid actuation mechanism from the fluid path. When a valve is energized, the solenoid retracts the armature that is attached to the flexible diaphragm. This raises the diaphragm allowing fluid to flow between the common port and an outlet. When de-energized a spring forces the diaphragm down, closing off the flow path. Because the fluid path can be made from extremely inert materials (such as PTFE and PEEK), Bio-Chem Valve™ Flow Selection Valves are particularly suitable for use in highly aggressive and / or high purity fluid applications.

Features of a Bio-Chem Valve™ Flow Selection Valve.

- **Range of orifice sizes and power ratings.** The Bio-Chem Valve™ Flow Selection Valve range covers orifice sizes from 0.032" (0.8mm) to 0.125" (3.2mm) with solenoids rated from less than 2 Watts to 8 Watts in continuous operation. This range means that standard valves can handle many mixing and flow selection applications.
- **Precise flow characteristics.** Each solenoid actuator on the Flow Selection Valve is individually adjusted at the factory to ensure equal flow rates at the same pressure.
- **Compact, robust construction.** Combining 2, 3, 4, 5, 6 or 8 valves into one manifold block saves significant space within an instrument. The integral construction eliminates the need for tubing sets between valves.
- **Minimal dead volume.** The manifold is specifically designed to reduce the internal volume of the valve leading to minimal dead volume when compared to single, stand-alone valves or compared to manifolds with removable valves. The elimination of tubing sets further reduces the total internal volume of the system.
- **Equal length flow paths.** The radial layout of the manifold block ensures that all flow paths are identical. There are no differences in flow path length and timing as would be found in linear manifolds.
- **Inert fluid path.** Bio-Chem Valve™ Flow Selection Valves employ the same method of construction as the range of Isolation Valves. All wetted parts are manufactured from inert, non-metallic materials.

Why choose a Flow Selection Valve?

Eliminate tubing between valves

Bio-Chem Valve™ Flow Selection Valves eliminate the need for tubing sets to connect between individual valves thereby reducing the number of connections and potential leak points.

Equivalence of internal flow paths

Unlike linear manifolds or valves connected by tubing sets, Flow Selection Valve flow paths are all the same length which means they have equal pressure drop, equal response times and equal internal volumes.

Individual control of flow paths

Unlike other valves with multiple ports, each flow path has its own associated actuation mechanism and can be controlled individually. This means that there is no need to pass one port to connect to another as with rotary valves.

Economic considerations

Flow Selection Valves offer an economic alternative to either: a) multiple single valves and their associated, necessary tubing sets, or b) multi-port valves that require sophisticated control systems for operation.

080T6 Flow Selection Valve. Note: Ports are equidistant from center common port ensuring that all flow paths are identical.

Applications

Bio-Chem Valve™ Flow Selection Valves are typically used in one of two main applications: Flow Mixing (flow from multiple inlets to one common outlet), and Flow Selection (flow from common inlet split into multiple outlets).

Flow Mixing

When Bio-Chem Valve™ Flow Selection Valves are used as flow mixing devices the flow from the inlets can be mixed together into a single stream under a variety of conditions:

- Each inlet can be selected individually so the outlet is one singular outgoing stream.
- Any combination of inlets can be selected so the outlet is a mixture of the incoming streams. Outlet composition will depend on pressure and fluid viscosity in each stream.
- Each inlet can be constantly adjusted to form a flow gradient. (Please discuss this special application with your regional sales office)

080T4 Flow Selection Valve used as flow mixing device

Flow Selection / Stream Splitting

When the flow pattern is reversed, Flow Selection Valves are used to divert flow from a common port to either a single or multiple outlets:

- In flow selection applications, the common inlet is diverted to one of the available outlets.
- For stream splitting, the common inlet is split between the available outlets either in a fixed or adjustable percentage. The split can be controlled from one outlet up to the maximum number of outlets in that valve.

080T4 Flow Selection Valve in flow splitting application

Flow Selection Valve Selection Guide

1. Select the number of valves / inlet ports. All Flow Selection Valves have the specified number of inlet ports PLUS a common port. For example, a 3-port valve has a total of four ports (three inlet and one common).
2. Select the orifice size. Orifice sizes range from Ø0.032" (0.81mm) to Ø0.125" (3.2mm).
3. Confirm that the appropriate materials of construction are available in the specified valve series (for material combinations not shown please contact your regional sales office).
4. Turn to the pages indicated to see full details and ordering information for each valve.

 PTFE = polytetrafluoroethylene

040T SERIES FLOW SELECTION VALVES

- 040T Flow Selection Valve available with either 3 or 4 valves / inlet ports and two orifice sizes (0.032" / 0.81mm and 0.054" / 1.4mm)
- Design based on 0.38" (9.5mm) diameter high efficiency solenoid
- Valve life above 2 million cycles
- Chemically resistant PPS or PEEK body with choice of PTFE, EPDM or FFKM diaphragm
- Low power requirements (1.9 Watts, 0.17 amps @ 12VDC; 1.9 Watts, 0.08 amps @ 24VDC) and minimal heat generation
- Maximum operating pressure = 20 psi

THE BIO-CHEM FLUIDICS BRAND FAMILY

Bio-Chem Fluidics is dedicated to providing instrument manufacturers and laboratories with the industry's best choice of inert, miniature fluid handling components.

Under the Bio-Chem Valve™ brand name we offer a complete fluid system solution for a wide range of industries including analytical chemistry, clinical diagnostics and medical device manufacturers as well as the scientific community.
